    <local\_source\_field3>  
        How should I treat finding/condition y (given situation z)? OR Should I  
use treatment/procedure x for condition/finding y? OR What is the efficacy of  
treatment/procedure x (for condition y)? OR Does procedure/treatment x work  
(for condition y)? OR Is treatment/procedure x indicated (for condition y)? OR  
What is the best treatment/procedure to do (for condition y)? OR Does the  
benefit of treatment/procedure x outweigh the risk? OR What are the options  
for treatment of condition y (in situation z)? OR Is there any treatment for  
condition y? OR What is the goal of treatment of condition y? OR At what  
level of severity of condition y is treatment indicated?  
    </local\_source\_field3>

        What is the cause of test finding x? OR What is the differential diagnosis
of test finding x? OR Could test finding x be condition y or be a result of
condition y? OR What is the likelihood that test finding x is coming from
condition y? OR How should I interpret test finding(s) x? OR How should I
use test finding x in my decision? OR At what level does the value of test x
become clinically important? OR What are the normal values (reference range)

```

```
of test x?

    What is the cause of test finding x? OR What is the differential diagnosis
of test finding x? OR Could test finding x be condition y or be a result of
condition y? OR What is the likelihood that test finding x is coming from
condition y? OR How should I interpret test finding(s) x? OR How should I
use test finding x in my decision? OR At what level does the value of test x
become clinically important? OR What are the normal values (reference range)
of test x?

<local_source_field3>
  In a broad sense, the question is nonclinical, but it does not fit any
other nonclinical category.

What is the cause of physical finding x? OR What is the differential  
diagnosis of physical finding x? OR Could physical finding x be condition y or  
be a result of condition y? OR What is the likelihood that sign x is coming  
from condition y? OR At what level does physical finding x become clinically  
important? OR What is considered normal for physical finding x?  
</local\_source\_field3>

        Is test x indicated in situation y? OR What test (or evaluation, or work
up), if any, is indicated/appropriate in situation y or with clinical findings
x1, x2, . . . , xn? OR What is the best test in situation y? OR Do the benefits

```

of doing test x (work up x) outweigh the risks? OR How do I diagnose condition y (meaning what test(s) or work up should I do)? OR How do I distinguish between conditions y<sub>1</sub>, y<sub>2</sub>, . . . , y<sub>n</sub> (meaning what test(s) or work up should I do)? OR How can you tell if the patient has condition y (meaning what test(s) or work up should I do)? OR Should this kind of patient have screening test x? OR What screening tests should this patient have?

<local_source_field3>
    Is drug x (or drug class x) indicated in situation y or for condition y?
OR What are the indications for drug x? OR Is any drug indicated for situation
y? OR Does drug x work for condition y? OR How effective is drug x for
condition y? OR What is the drug of choice for situation y or for condition y?
OR What are the options for drug treatment of situation y or condition y? OR
Is drug x1 better than drug x2, x3, . . . , xn for condition y? OR Is drug x1
just as effective as drug x2 (in situation y)? OR Does the benefit of giving
drug x outweigh the risk?

    <local\_source\_field3>  
        What is the cause of test finding x? OR What is the differential diagnosis  
of test finding x? OR Could test finding x be condition y or be a result of  
condition y? OR What is the likelihood that test finding x is coming from  
condition y? OR How should I interpret test finding(s) x? OR How should I  
use test finding x in my decision? OR At what level does the value of test x  
become clinically important? OR What are the normal values (reference range)  
of test x?  
    </local\_source\_field3>
